## ABSTRACT

The present invention relates to a  $\beta$ -catenin oligonucleotide microchip for detecting mutation in the mutational hot spot regions of  $\beta$ -catenin gene, a manufacturing process thereof and a method for detecting the  $\beta$ -catenin mutation employing same, wherein specific oligonucleotides are selectively designed to detect various missense mutations and in-frame deletion at the mutational hot spots of  $\beta$ -catenin gene. The  $\beta$ -catenin oligo chip of the present invention can be used in studies to detect  $\beta$ -catenin mutations and unravel the signal transduction mechanism and tumorigenesis related to  $\beta$ -catenin gene.
